# **Why open source projects needs a business model?**

- 
- Maintainers need to spend a significant amount of time reviewing pull requests, working on new issues etc.
  - Hard to manage when you are working on a full time job.

- 
- You can't rely only on unpaid volunteers to drive the development of the project.
  - Most big open source projects needs multiple people working on it full time to be successful.
  - And to hire them you need a sustainable source of income.

For example, most of the Linux Kernel contributors are employed by companies like Intel, Red Hat, Samsung etc to contribute to kernel full time.

**Also, the revenue  
incentivizes you to work  
on the project more and  
make it even better.**

If it's not fun anymore, you get  
literally nothing from  
maintaining a popular package.

**Dominic Tarr**  
**@dominictarr**

Having a sustainable source of revenue help you plan ahead of time.

Also helps you compete with proprietary software projects from big companies by hiring better engineers.

Revenue can be also used as a good matrix of how well the project is doing.

GitHub stars doesn't convey much other than popularity.

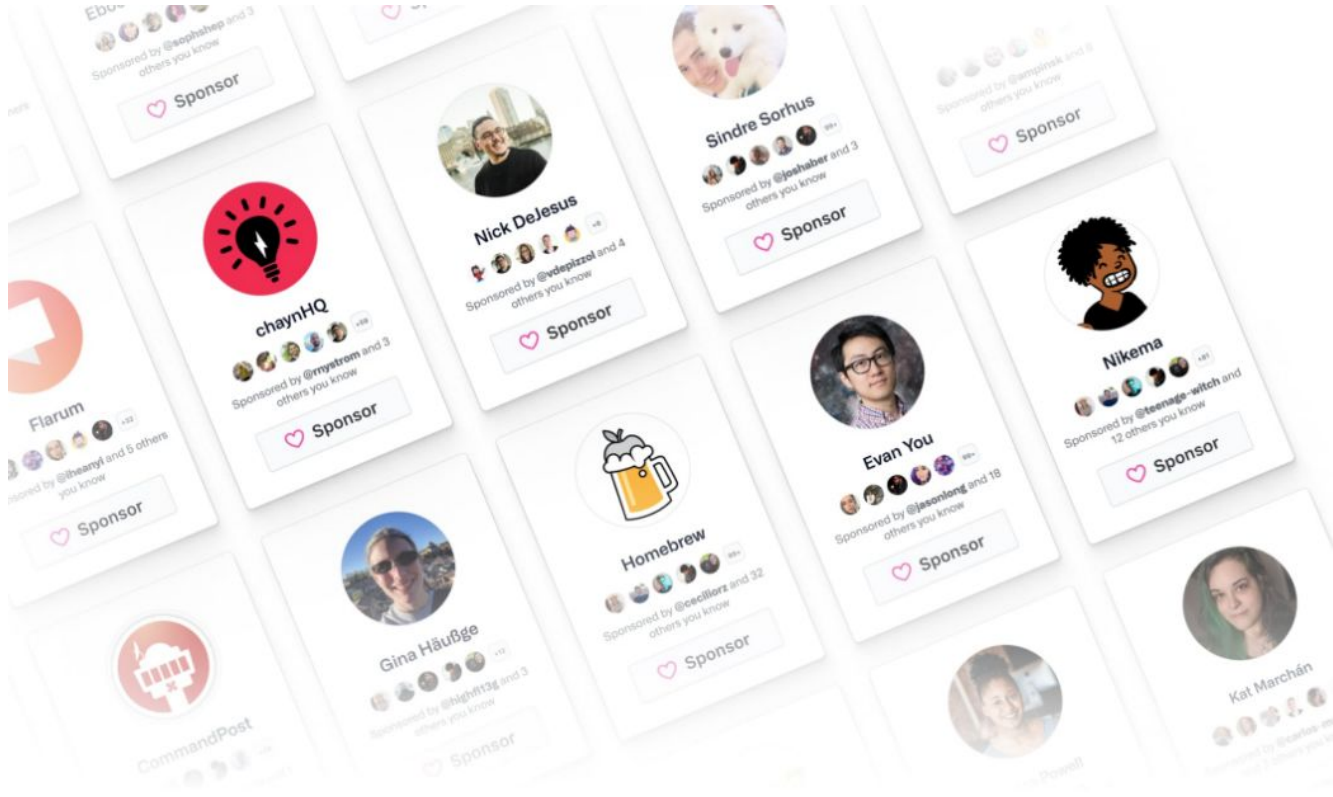

# **Common Open Source Business Models**

# Donations

**Accept recurring or one  
time donations from users.**

GitHub sponsors

# Pros

---

- 
- Super easy to set up.
  - No additional effort required for making this work.

# Cons

---

Very little money in  
donations.

Hard to convince  
companies to donate  
than buying the  
software.

# About Sindre Sorhus

Hey, I'm [Sindre](#) 🦄

I love open source. For more than 4 years I've been working on open source full-time, 8-12 hours a day, while living off savings. I'm on Patreon now as my savings are slowly running out and I need your help to continue my open source efforts.

I actively maintain [1100+](#) npm packages ([2 billion downloads a month](#)) and [many popular projects](#). You're probably depending on some of my packages in your dependency

[Show more](#)

## GOALS

[View all](#)

**\$487.11 of \$4,000** per month

If this goal is met, I can spend less time thinking about money and private monetization channels (e.g. taking on consulting contracts, paid apps, etc) outside of work hours and instead spend that time on educational content that would benefit the community, for example, blog posts, screencasts, etc.

**\$6.76 \* 210 (GitHub sponsors)**

**=**

**\$1888.96 < \$4,000**

# Open Core

- 
- Core functionality is available for free and open source.
  - Additional features are released as paid proprietary software.

## GitLab Community Edition

GitLab Community Edition (CE) is an open source end-to-end software development platform with built-in version control, issue tracking, code review, CI/CD, and more. Self-host GitLab CE on your own servers, in a container, or on a cloud provider.

Address feedback about wording.

2 years ago

- 
- Valued over \$6 Billion.
  - 1000+ employees
  - VC funded

# Some other notable companies

- Neo4j
- Redis
- Elastic
- MySQL
- Cassandra

# Pros

- Easy to scale with more customers.
- Possibility to charge per user in a company. (Additional revenue without any marketing or sales)
- Recurring revenue.

---

# Cons

- 
- Not really open source.
  - Disincentivized to add important features to the open source version.

# SaaS (Software as a Service)

- 
- Charge customers for hosting the online web service of the product.
  - Typically also provides customer support
  - Usually prioritizes feature requests from paying customers.

# Companies

---

- Zulip
- Automattic (\$3 billion valuation)
- Ghost.org (Non profit)
- Sentry (\$100 million+ valuation)

# Pros

---

- Recurring revenue
- Easy to scale to large number of customers.
- Can charge per user.
- Aligned with the development of the open source project.

# Cons

---

- Other companies can offer the SaaS offering of your open source project.
- Sometimes it's hard to convince users to pay for the SaaS service than hosting it by themselves.

## Re-Licensing Sentry

DAVID CRAMER

More than a decade ago, a **small piece of code** that would eventually be called Sentry was born. When I wrote this code, I didn't know much about open-source, so when it came down to licensing, I just grabbed the first reasonable suggestion thrown my way. That suggestion happened to be the **BSD 3-Clause License**.

Fast forward to today, and a lot has changed. Sentry is far more than that original 70-line snippet; it's a complex product made up of millions of lines of code that is used by tens of thousands of businesses around the world. It's also no longer a personal project; it now employs nearly 100 individuals who depend on it for their livelihood.

Sentry – both the project and the company – is large enough now to question whether the licensing decision made 11 years ago was the right one.

For example, this past year, we've had to deal with funded businesses **plagiarizing or copying our work** to directly compete with Sentry. This has included **taking marketing content from our website, plagiarizing our documentation** and framing it as their own, or **straight-up copy/pasting** our product visuals.

Sentry has now moved it's projects to  
**Business Source License** from Apache  
2.0, MIT and BSD 3-Clause.

- 
- You cannot offer a commercial version of Sentry's service (the license grant restriction)
  - After 36 months, the code becomes Apache-2.0 licensed (the conversion period)

- Zulip is an open source group chat application.
- Focuses heavily on topics.

Tim Abbott

11:06 PM

@Robert you can try applying this patch:

```
Author: Tim Abbott <tabbott@zulip.com>
Date: Sun Sep 13 15:45:02 2020 -0700

    presence: Disable live presence updates in larger realms.

diff --git a/zerver/lib/actions.py b/zerver/lib/actions.py
index fe17a2e263..9fc9f9757 100644
--- a/zerver/lib/actions.py
+++ b/zerver/lib/actions.py
@@ -4075,13 +4075,17 @@ def do_update_user_activity(user_profile_id: int,
    activity.save(update_fields=["last_visit", "count"])

def send_presence_changed(user_profile: UserProfile, presence: UserPresence) -> None:
+    # Performance mitigation for excessive presence changes.
+    user_ids = active_user_ids(user_profile.realm_id)
+    if len(user_ids) > 100:
+        return
    presence_dict = presence.to_dict()
    event = dict(type="presence",
                 email=user_profile.email,
                 user_id=user_profile.id,
                 server_timestamp=time.time(),

+    send_event(user_profile.realm, event, user_ids)

def consolidate_client(client: Client) -> Client:
    # The web app reports a client as 'website'
```

Just to provide some context, what it'll mean is that when a user goes from completely offline to online in the morning, it'll take a minute for them to appear as active, rather than the <1s that it is without this patch. The benefit is that it'll remove 100% of the load related to presence that you're seeing, which sounds like 90% for your server. My guess is this will completely resolve your problem with pretty minimal downside.

# History of Zulip Inc

# Zulip Sprint in Pycon 2017, Portland

# Zulip Business Model

# SaaS

## Free plan

- Limited storage (5GB for entire organization)
- Limited message history (10k messages)
- Some enterprise features like guest users, user groups etc are limited.

# SaaS

## Standard plan

- \$8/user/month or \$80/user/year
  - No message history limit
  - Increased storage (10GB per user)
  - Full access to enterprise features.
  - Priority support
- 
- Free for open source projects and events.
  - Heavily discounted (85% - 100%) for
    - Educational institutions
    - Non profits
    - Group of friends
    - etc

# Enterprise support for on premise installations

- Support response SLAs
- High availability assistance
- Input to Zulip roadmap

# Charging for the push notification forwarding service

- iOS and Android apps will only allow trusted servers mentioned in the app to send push notification.
- This means self hosted servers have to recompile the app and publish it on their own.
- As a better alternative, Zulip runs a central push notification forwarding service on behalf of self hosted servers.
- We currently give away the service for free, but has plans to charge companies which sends a lot of push notifications.

# Grants

Zulip has received nearly 1 million dollars in **SBIR** grants from the **US National Science Foundation**.

**SBIR**  
America's Seed Fund

# Donations

- Has GitHub sponsors enabled.
- Not much success from the model.

# Consulting

- We often get requests to customize Zulip specifically for a company.
- But have not pursued that direction since it's not aligned with best interest of open source project.
- Also super hard to scale since the company specific customizations in most cases are useless for other customers.

Questions?
